

Ideation Phase

Brainstorm & Idea Prioritization

Date	30 JUNE 2026
Team ID	
Project Name	Human Development Index (HDI) Predictor
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization :

Brainstorming is a structured ideation technique used to generate, organize, and evaluate potential solutions for a problem. For the Human Development Index (HDI) Predictor, the team explored multiple ideas related to dataset preparation, machine learning models, web application development, visualization techniques, and deployment strategies. The generated ideas were then grouped into meaningful categories and prioritized based on their importance, urgency, feasibility, and project impact. This process enabled the team to identify the most suitable solution for developing an accurate, user-friendly, and scalable HDI prediction system.

During this activity, multiple ideas were generated regarding dataset selection, data preprocessing, visualization methods, machine learning algorithms, web application development, and future enhancements. All ideas were discussed openly without immediate evaluation to encourage creativity and innovation.

After generating a wide range of ideas, the team prioritized them based on their feasibility, technical complexity, relevance to the project objectives, and potential impact. This structured approach helped identify the most practical solution for developing an accurate, user-friendly, and scalable HDI prediction system.

Step-1: Team Gathering, Collaboration and Select the Problem Statement
